New Features

AUDIT LOG REPORTING

Three new audit reports have been added to allow insight into activity on the system.

The Browser Log Report Captures events viewed by analysts.

The Audit Log Report Captures modifications to the analytic definitions and event data.

The Request Log Report Captures data requests made by the UI.

Administrative users with the appropriate roles can access and download these reports from the User Interface. The reports are downloadable as `.csv` files.

ENTITY RISK CONTEXT REPORT

The Entity Risk Context report allows analysts to build an entity risk report on a selected user, that can be exported to `.pdf`. The report will include an active scenario graph, risk score breakdown, score comparison, event breakdown, and a top features graph.

ENHANCED EMAIL DECODING

Forcepoint Behavioral Analytics now has the ability to decode email data using the ISO-2022-JP Character Set.

ENHANCED EMAIL PARSING CAPABILITIES

Expanded the PST Parser utility's capability to enable the text content of an embedded email message within a PST file to be parsed and displayed as a `.txt` file in FBA.

PKI-BASED USER AUTHENTICATION

We have introduced a PKI-based method for users to authenticate into the Forcepoint Behavioral Analytics UI. This enables customers to enable and disable users based on their certificate. This feature can be enabled or disabled via configuration. Also available is a hybrid mode wherein users can authenticate using either certificate or local username and password.

Admins in certificate-enabled environments manage users in the User Management page, where a user DN can be entered, enabling that user to authenticate with a certificate.
