

v3.4 Release Notes for Forcepoint Behavioral Analytics

Release Notes | Forcepoint Behavioral Analytics | v3.4 | 17-Feb-2021

Use the Release Notes to find information about what's new and improved in Forcepoint Behavioral Analytics version 3.4.

Features

Containerization

We have updated the installation package to enable customers to install Forcepoint Behavioral Analytics in a customized directory and under a custom, provisioned user. This change allows customers to run all of Forcepoint Behavioral Analytics under a single directory, controlled by a single user, following the least-privileges model for user permissions. The application also now includes an allow list of sudo commands, which are used during the installation or upgrade of a Forcepoint Behavioral Analytics instance.

Updated EULA in UI

The End User License Agreement has been updated and is available in the UI. Users will be required to accept the new EULA when they log into the Forcepoint Behavioral Analytics application.

SAML configuration property field has been renamed

The SAML config property field has been renamed from `samlEmailField` to `samlNameID` in the `server/config/saml_config.js` if the file exists.

Modify the FBA app user authentication flow to incorporate DoD PKI-based user authentication

We have introduced a PKI-based method for users to authenticate into the Forcepoint Behavioral Analytics UI. This enables customers to enable and disable users based on their certificate. This feature can be enabled or disabled via configuration. Also

available is a hybrid mode wherein users can authenticate using either certificate or local username and password.

Admins in certificate-enabled environments manage users in the User Management page, where a user DN can be entered, enabling that user to authenticate with a certificate.

Known Issues

A list of resolved and known issues in this release is available to Forcepoint Behavioral Analytics customers [here](#).
